- 1. (Amended) A method of preparing thermally stable transitional alumina stabilized with additions of lanthanum comprising the steps of:
  - a) providing an aqueous solution of an aluminum salt and a lanthanum salt;
  - b) treating the solution with an inorganic hydroxyl group anionexchanger to produce a composition comprising aluminum hydroxides and lanthanum hydroxides;
  - c) freeze-drying the hydroxide composition to produce an aluminum hydroxide powder containing lanthanum; and
  - d) dehydrating the aluminum hydroxide powder to yield particulates of  $\gamma$ -alumina stabilized with lanthanum.
- 6. (Amended) A method of preparing thermally stable transitional alumina stabilized with additions of lanthanum comprising the steps of:
  - a) providing an aqueous solution of an aluminum salt and a salt of a lanthanide series element;
  - b) treating the solution of aluminum and lanthanide series element with an inorganic hydroxyl group anion-exchanger to produce a composition comprising aluminum hydroxides and hydroxides of the lanthanide series element;
  - c) freeze-drying the hydroxide composition to produce a powder comprising the aluminum hydroxides and the hydroxides of the lanthanide series element; and
  - d) dehydrating the powder to yield particulates of thermally stable  $\gamma$ -alumina containing the lanthanide series element.

## **REMARKS**

Pursuant to the restriction requirement, claims 14-16 have been cancelled.
